

Introduction To Recursion

* A function calling itself is called as Recursion.

```
Void print() {
    print();
}
```

* If we write return statement in a method it ends the method irrespective of lines below return statement.

* PMI: Principle of Mathematical Induction

→ Sum of first n natural numbers for any given n.

To prove: $\sum_{i=1}^n i = \frac{n(n+1)}{2} = \text{Sum}(n)$

Σ represents
 $1 + 2 + \dots + n$

Assumption: $\sum_{i=1}^k i = \frac{k(k+1)}{2} = \text{Sum}(k) \rightarrow \text{Assumption}$

Proof: 1: $\sum_{i=1}^{k+1} i = \frac{(k+1)(k+2)}{2} \rightarrow \text{Self Work}$

2: $n=1 \rightarrow \text{Sum}(1) = \frac{1(1+1)}{2} = 1 \rightarrow \text{Base case}$

Proof: $\sum_{i=1}^{k+1} i = \underbrace{1 + 2 + 3 + \dots + k}_{\downarrow} + (k+1)$

$$\sum_{i=1}^{k+1} i = \sum_{i=1}^k i + k+1$$

$$= \frac{k(k+1)}{2} + k+1$$

$$= k+1\left(\frac{k}{2} + 1\right)$$

$$= \frac{(k+1)(k+2)}{2}$$

L.H.S = R.H.S

problem - WAP to print all natural numbers from 1 to n using recursion

```
static void printIncreasing(int n) {
    if (n == 0) {
        System.out.println("Base case");
        return;
    }
    printIncreasing(n-1);
    System.out.println(n);
}
```

// 1 2 3 ... n-1
// n
}

$$PI(5) = 1 2 3 4 5 \Rightarrow (PI(n) = PI(n-1)) n$$

$$PI(4) = 1 2 3 4 \Rightarrow PI(4) 5$$

$$PI(3) = 1 2 3$$

$$PI(2) = 1 2$$

$$PI(1) = 1$$

LIFO

* void func1() {

int x = 1; L1

func2(); L2

System.out.println(x); L3

}

void func2() {

int x = 2; L1

func3(); L2

System.out.println(x); L3

}

void func3() {

int x = 3; L1

System.out.println(x); L2

}

System.out.println(x); L3

}

Call stack

x = 3
func3

x = 2
func2

x = 2
func1

Main Stack frame

Call stack

→ Stack frame stores local variables of current line which is executing

→ let say func2 line 2 is called i.e. func3 after completing the func2 line 3 will be executed in func2.

→ Stack frame of func will be removed after completing the func execution

olp - 3 2 1

Print 1 to n natural numbers

* Static void printIncreasing(int n)

```

L1 if(n==1)
L2     cout<<1;
L3     return;
L4 }
L5     printIncreasing(n-1); // 1, 2, 3 (expectation)
L6     cout<<n;           // 4) self work problem
}

```

}

psvm()

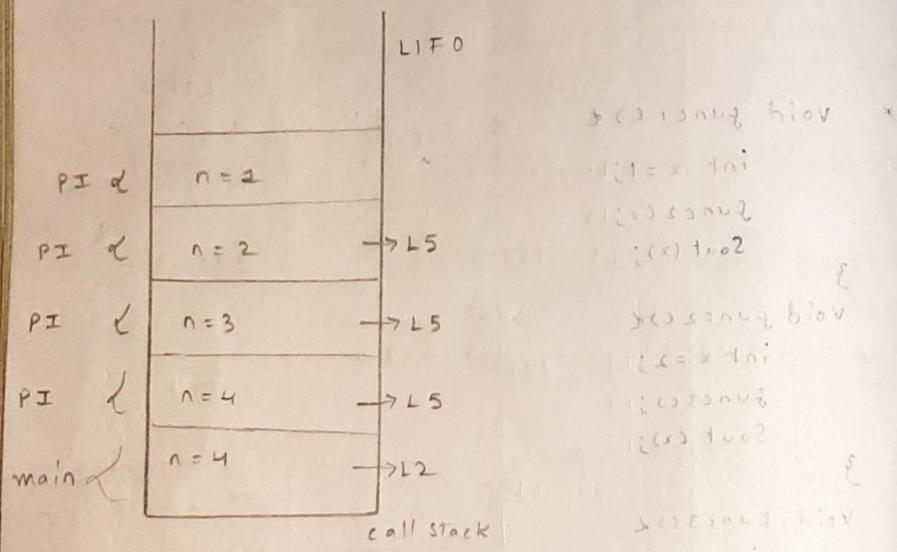

```

L1 int n=4;
L2 printIncreasing(n);
}

```

olp - 1 2 3 4

Dry run In call stack:

main → PI(4) → PI(3) → PI(2) → PI(1)
 ↓
 printing is done in this order (LIFO)

olp → 1 2 3 4

Recursion - A function calling itself with different parameters & a base case to terminate the infinite loop

* In Recursion we solve a bigger problem by solving smaller subproblems

* We represent the problem in terms of functions
 i.e. $PI(n) \leftarrow \text{Problem}$

$PI(n-1) \leftarrow \text{Subproblem}$

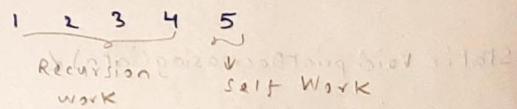

→ A function calls itself to solve its subproblems.

Steps for Solving Recursion problem

The Recursion Spell (High level Thinking)

1 Identifying the Smaller problem → Let Recursion solve it (Show full faith in Recursion (The Recursive Leap of Faith) do not doubt it.)

2 Self Work - Do your work (Solve remaining)

3 Base Case (Identify the base case) →

Smallest problem for which the answer is very obvious and simple. (and doesn't depend on any subproblem)

Note: Identify first which is to be done

Self work / Recursive work

Working of Recursive Function

Syntax:
functionName(N Parameters)

```

    if condition
        return result
    else
        recursive call
            return methodName(N Parameters)
}
# Self work
}

```

problem - WAP to print all Natural No's from n to 1 using recursion. n≥1

Self work PD(5) → 5, 4, 3, 2, 1 Recursive work
 PD(n) → n, n-1, ..., 1

1. Smaller problem : PD(n-1) no. of print

2. Self work : Sout(n)

3. Base case : n=1 → Sout(1)

Static void printDecreasing(int n) {

```

L1 if (n==1) {
L2     Sout(1); and print();
L3     return; hidden ref. missing function
L4 }
L5 Sout(n);
L6 printDecreasing(n-1); PD
}
L7
n=4
expected o/p - 4 3 2 1
o/p - 4 3 2 1
main d
main → P(4) → P(3) → P(2) → P(1)
    
```

32 Solving factorial & fibonacci problems by Recursion

problem - Find the value of factorial 5n,
where $n \geq 0$

Subproblem → f(n-1)

$$f(5) \rightarrow 5 \times 4 \times 3 \times 2 \times 1$$

$$\vdots f(4)$$

$$f(n) \rightarrow n \times n-1 \times \dots \times 1$$

Self work → $n \times f(n-1) = f(n) \rightarrow$ This term eq is called Recurrence Relation

Base case → if ($n == 0$) {
 (n=0) know this
 {
 1. n=0
 2. return 1;
 }

5 * factorial(4)

5 * 4 * factorial(3)

5 * 4 * 3 * factorial(2)

5 * 4 * 3 * 2 * factorial(1)

5 * 4 * 3 * 2 * 1

static int factorial(int n) {

1. if ($n == 0$) {

return 1;

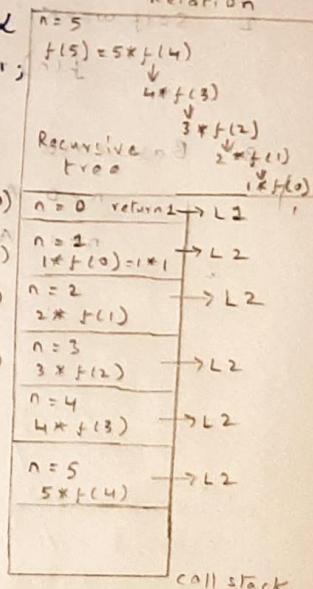

}

2. int fact = n * factorial(n-1);

3. return fact;

{ int smallAns = factorial(n-1);

return n * smallAns;

expected o/p - 5*4*3*2
 x1=120

o/p - 120

problem - To find n^{th} fibonacci number
considering is same as finding previous
number by formula

He is invited to enter our unit, making
10-70 available.

$t_{\text{exam}} = 0, 1, 2, 3, 4, 5, 60 \text{ min}$

0 1 1 2 3 5 8 13 - meidsongak 74

$$\text{current term} = (\text{current term} - 1) + (\text{current term} - 2)$$

$$\text{current term} = (\text{current term - 1}) + (\text{current term - 2})$$

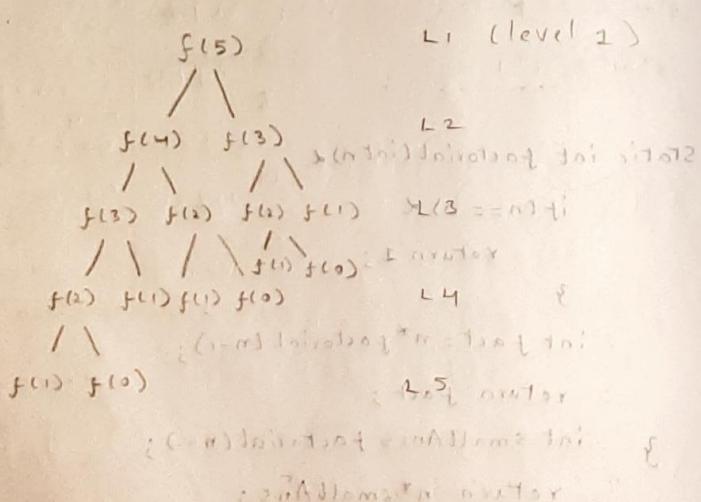

1. Subproblem

$f(n-1)$ } find
 $f(n-2)$ } using recursion

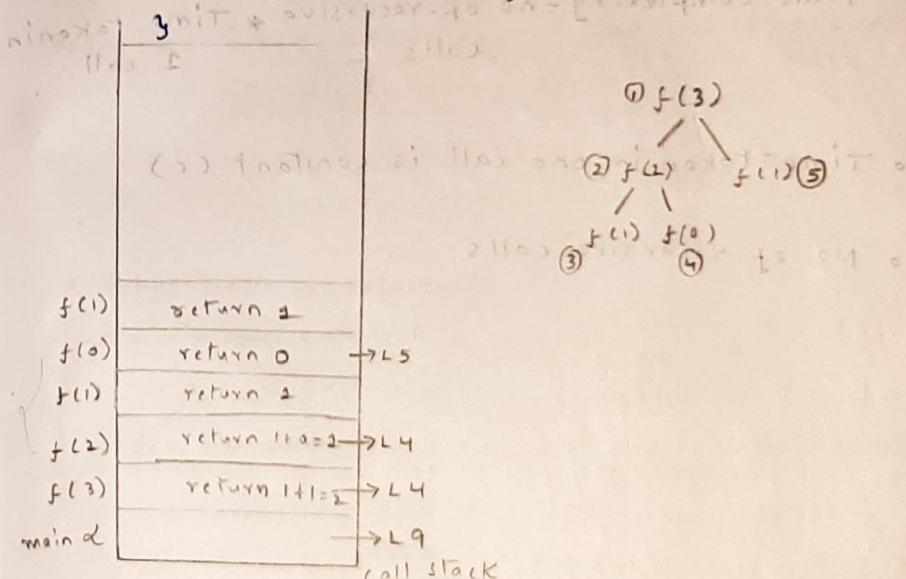

$$f(n) = f(n-1) + f(n-2)$$

3 Base case (subproblem doesn't exist for these cases)

2-1 Ans 1

```
static int fib(int n) {
    L1 if(n == 0 || n == 1) {
        L2     return n;
    L3 }
    L4     int prev = fib(n - 1);
    L5     int prevPrev = fib(n - 2);
    L6     return prev + prevPrev;
}
L7
L8 public static void main(String[] args) {
```

→ Factorial

Time complexity = No of recursive calls * Time taken in 1 call

$$= (n+1) \leq n + c \text{ (constant)}$$

$$= n c \leq o(n)$$

• $n+1$ because if $n=5$ $f(5) \rightarrow f(4) \rightarrow f(3) \rightarrow f(2) \rightarrow f(1)$
 \downarrow
 $f(0)$

Space complexity $\rightarrow O(n)$ because n 's stack frame if the $n=4$ the stack frames are 4.

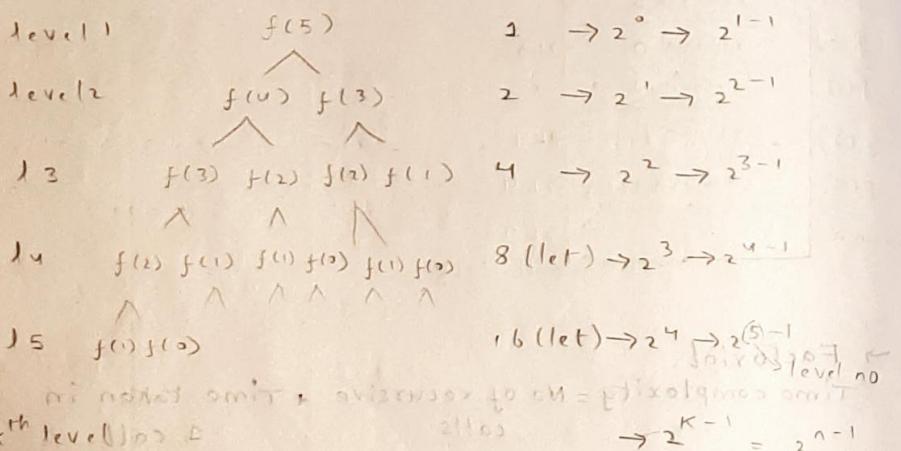

- * Basically after seeing the code of recursive functions we can't say the space complexity until after seeing the call stack memory i.e. how many stack frames were used.

→ Fibonacci

Time Complexity = no. of recursive * Time taken in calls

- Time taken in one call is constant (c)

- No. of recursive calls

* We need to find Total no. of calls i.e. $f(5)$

$$2^0 + 2^1 + 2^2 + 2^3 + \dots + 2^{n-1} \quad (\text{AP Geometric progression})$$

$$\frac{2(2^n - 1)}{2-1} = \frac{2^0(2^n - 1)}{2-1} = 2^{n-1} \leq 2^n$$

$Tc = \text{no. of recursive calls} * \text{Time taken in 1 call}$

$$Tc = 2^n * c \leq 2^n$$

$$Tc = O(2^n)$$

Space Complexity $\rightarrow O(n)$

$$S + (S+1) \downarrow$$

Sum of Digits and Power of Number using Recursion

Problem: Given an Integer, find out the sum of its digits using recursion

$$n = 513 \Rightarrow 5 + 1 + 3 = 9$$

$$n = 1234 \Rightarrow 1 + 2 + 3 + 4 = 10$$

* Subproblem & selfwork

$n = \underbrace{1 \ 2 \ 3}_{\downarrow} \ 4 \rightarrow \text{last digit (selfwork)}$
 $(\text{sum}) 6 \boxed{(d-1) \text{ digits}} \ (\text{subproblem})$

Let the given number have d digits e.g. $n = 1234 / d = 4$

→ Recursively find $(d-1)$ digits sum (smallAns)

→ Ans = smallAns + lastDigit

* If we want to find the last digit of a number use $\%$ (modulus) i.e.

$$1234 \% 10 = 4$$

* If we divide the number / 10 we get the $(n-1)$ digits i.e. $1234 / 10 = 123$

$$f(1234) = f(123) + f(4)$$

$$f(n) = f(\frac{n}{10}) + n \% 10$$

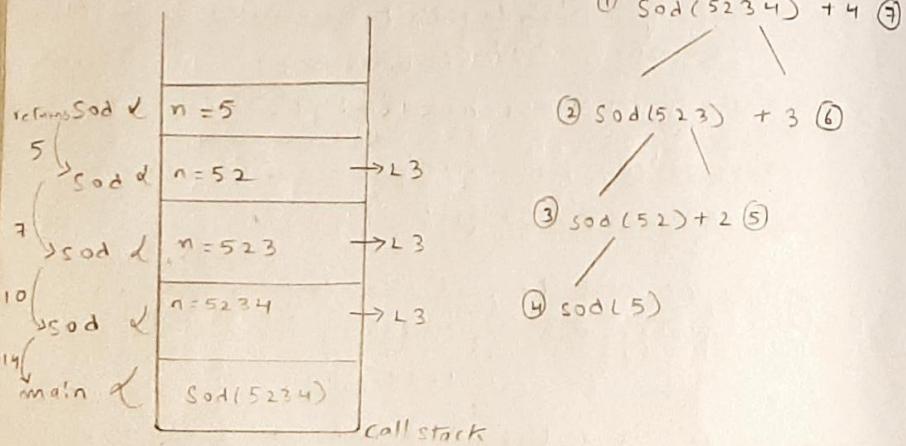

$$\begin{array}{ccc} \downarrow & \downarrow & \downarrow \\ \text{Sum of digits} & \text{Sum of all digits except last digit} & \text{last digit} \\ \text{of } n & & \end{array}$$

* Base case
 $\text{if } (n \geq 0 \text{ & } k \leq n \leq 9)$
 $n = 1234$
 $n \% 10 = 4$
 $n / 10 = 123$
 $\text{return } n;$

* $SOD(1234) = SOD(123) + 4$
 $\text{if } (n \geq 0 \text{ & } k \leq n \leq 9)$
 $n \% 10 = 2$
 $n / 10 = 12$
 $\text{return } SOD(12) + 3$
 $\text{if } (n \geq 0 \text{ & } k \leq n \leq 9)$
 $n \% 10 = 1$
 $n / 10 = 1$
 $\text{return } SOD(1) + 1$

→ max digit two digit, so return 2
* L1 static int sod(int n)
L2 if (n ≥ 1 & k ≤ n ≤ 9) return n;
L3 return sod(n/10) + n%10;

L4 y

$$= 14$$

$$(1+4)+(2+3)+(1+2)+1 = (1+4)+(2+3)+(1+2)+1 = 14$$

Digit count 4, sum of digits 14

$$\begin{aligned} \text{Time complexity} &= \text{No. of recursive calls} * \text{Time taken in one call} \\ &= d * c \text{ (constant)} \\ &\quad \uparrow \\ &\quad (\text{no. of digits}) \end{aligned}$$

$$O(dc) \approx O(d)$$

$$\text{Space complexity} = O(d)$$

* Follow up question

→ return the count of digits in a given number n

$$n = 5683 \quad n = 534$$

$$\text{ans} = 4 \quad \text{ans} = 3$$

Static int CountOfDigits(int n) {

if (n > 0 & n ≤ 9)

return 1;

return CountOfDigits(n/10) + 1;

* Subproblem & self work

$$n = 1234$$

return 2 (because 1 digit)
 $cod(n/10)$

count is always 1)

* Base case

if (n ≥ 0 & n ≤ 9)
 $n \% 10 = 1$ // because single digit
 $n / 10 = 0$
 $\text{count is } 1$

(1) cod(1234) + 1 (7) n = 1234
(2) cod(123) + 1 (6) Ans = 4
(3) cod(12) + 1 (5)
(4) cod(1) + 1 (4)

K Multiples & Alternate Sum Series using Recursion

Problem - Given a number num and a value K.
print K multiples of num

constraints: $K > 0$

Input 1: num=12, K=5

Op 1: 12, 24, 36, 48, 60

Input 2: num=3, K=8

Op 2: 3, 6, 9, 12, 15, 18, 21, 24

Big problem: $f(n, K) \rightarrow$ prints first K multiples of n

small problem: $f(n, K-1) \rightarrow$ faith
(recusive work)

self work: print $n * K$

Base case: if ($K == 1$) sout(n) return;

$f(5, 4)$

↓

$f(5, 3)$

↓

$f(5, 2)$

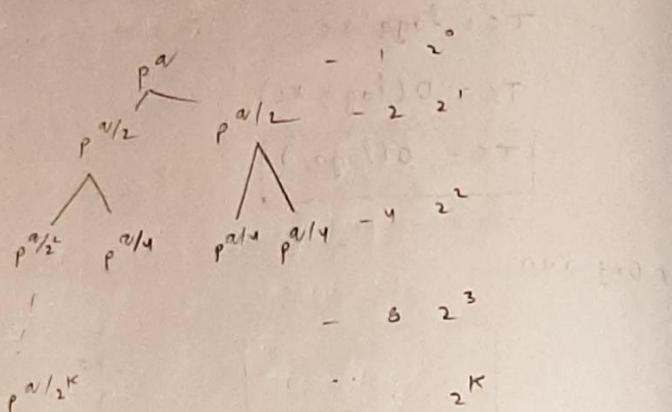

↓

Basecase $f(5, 1)$

$(5, 4) \rightarrow 5 \underline{10} \underline{15} \underline{20}$

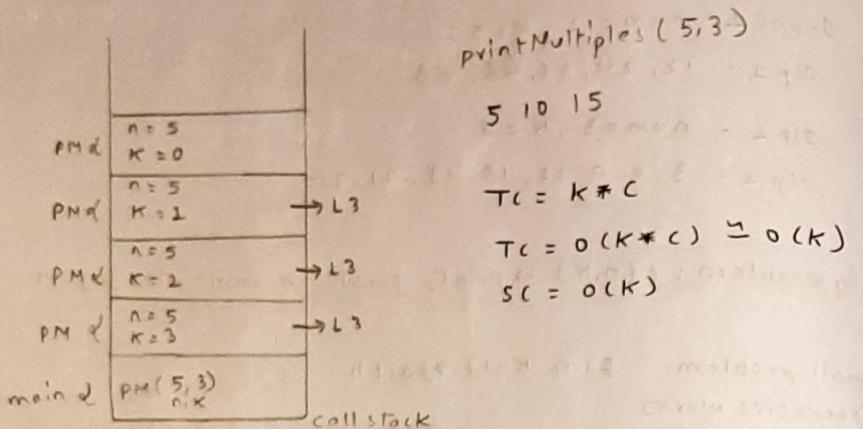

Recursive work Self work

* Instead of previous code i.e smallPow + SmallPow
if we have written $(\text{pow}(P, \frac{\alpha}{2}) + \text{pow}(P, \frac{\alpha}{2}))$
we are calling the function 2 times.

HE

```
* static void printMultiples (int n, int k) {
    L2 if (k == 0) return;
    L3 printMultiples (n, k - 1);
    L4 System.out.println (n * k);
L5 }
```

Problem - Given a number n . Find the sum of natural numbers till n but with alternate signs.

That means if $n=5$ then you have to return $1 - 2 + 3 - 4 + 5 = 3$ as your answer

constraints: $0 \leq n \leq 10^6$

input - $n=10$

output - -5

input - $n=5$

output - 3

question - $n=5$

$$1+2+3+4+5 = 15$$

$f(n) = f(n-1) + n$
 ↓ ↓ ↓
 bigger smaller self
 problem problem work
 sum of recursive work
 1 to n 1 to n-1

Basecase: if ($n==0$)
 return 0;

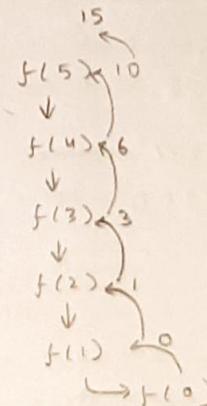

* static int SeriesSum1 (int n) {

if ($n==0$)

return 0;

return SeriesSum1 ($n-1$) + n;

}

$$n=5 \quad f(n) = 1 - 2 + 3 - 4 + 5 = 3$$

$f(n) = f(n-1) + n$ recurrence relation

$n=6$

$$f(6) = 1 - 2 + 3 - 4 + 5 - 6 = -3$$

$f(n) = f(n-1) - n$ recurrence relation

if n is odd add
 if n is even subtract

GCD & Euclid's Algorithm using Recursion

problem - Given two numbers x and y . Find the greatest common divisor of x and y using recursion.

constraints: $0 \leq x, y \leq 10^6$

Input: $x = 4, y = 9$

Output: 1

* $x = 24 \Rightarrow 1, 2, 3, 4, 6, 8, 12, 24$

$y = 15 \Rightarrow 1, 3, 5, 15$

Common Divisors $\Rightarrow 1, 3$

Greatest Common Divisor $\Rightarrow 3$

* $x = 16 \Rightarrow 1, 2, 4, 8, 16$

$y = 12 \Rightarrow 1, 2, 3, 4, 6, 12$

Common Divisors $\Rightarrow 1, 2, 4$

GCD $\Rightarrow 4$

Brute force Approach - Refer code in VS Code

$x = 12, y = 16$

$\text{gcd}(x, y) \leq \min(x, y)$ i.e GCD will be less than 12, 16 it will not be in between 12 & 16.

* Divide both the numbers

from	12	16
12	✓	✗
11	✗	✗
10	✗	✗
9	✗	✗
8	✗	✓
7	✗	✗
6	✓	✗
5	✗	✗
4	✓	✓

Time complexity will be -
 $O(\min(x, y))$

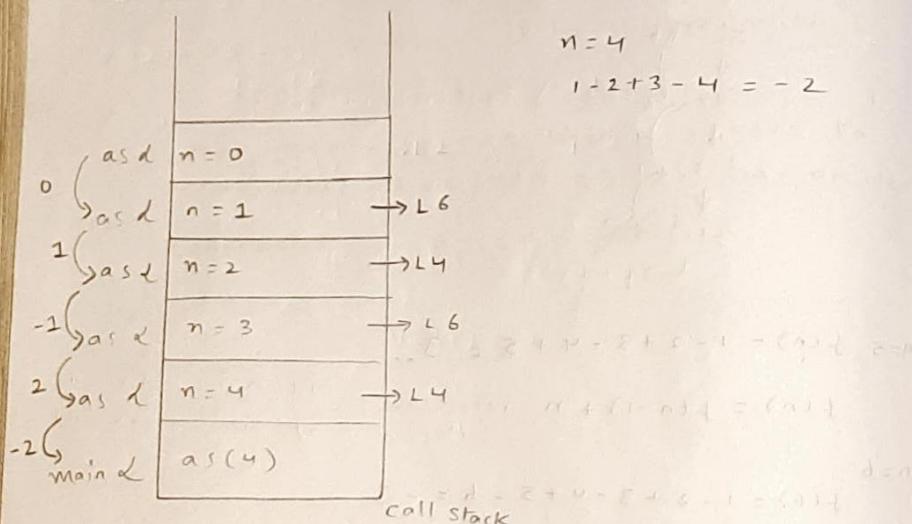

(both 12 & 16 can be divided by 4 which is GCD)

$$f(n) = \begin{cases} f(n-1) + n & \text{if } n \text{ is odd} \\ f(n-1) - n & \text{if } n \text{ is even} \end{cases}$$

Base case - if $n == 0$
 return 0;

```
* L1 static int alternateSeries(int n)
L2     if (n==0) return 0;
L3     if (n%2==0) {
L4         return alternateSeries(n-1) - n;
L5     } else {
L6         return alternateSeries(n-1) + n;
L7     }
L8 }
```

* Dry run

$$TC = n \times c$$

$$TC = O(n)$$

四

$$* \quad x = 4, y = 9$$

4	✓	9
4	✓	✓
3	✗	✓
2	✓	
1	✓	

Approach 2 - (Long Division method) (Iterative)

$$\begin{array}{rcl} \text{e.g.} & x = 24 \\ & y = 15 \end{array}$$

$$\begin{array}{r} \text{divisor} \quad \text{dividend} \\ \uparrow \quad \uparrow \\ 15) 24 (1 \end{array}$$

$$\begin{array}{r} \text{dividend} \\ \xrightarrow{\quad\quad\quad} 15 \\ \text{divisor} \leftarrow 9) 15(1 \\ \underline{-9} \\ 6 \quad\quad\quad \leftarrow 9(1 \end{array}$$

$$\begin{array}{r} \overline{15)24(1} \\ \underline{-15} \quad 9 \\ \underline{\quad 9} \quad 0 \\ \end{array}$$

Answer: $\overline{108}$, $x = 1$ \leftarrow $55 - 47$

$$\text{eq 2} - x = 12 \quad \leftarrow \text{cancel } 3 \text{ from both sides}$$
$$y = 16 \quad \leftarrow \text{divide by 4}$$

$$\begin{array}{r} 16) 12 (0 \\ \underline{0} \\ 12) 16 (1 \\ \underline{12} \\ 4) 12 (3 \\ \underline{4} \\ 0) \end{array}$$

GCD for 2 prime numbers is always 1

Approach 3 - Euclid's Algorithm

Euclid's Algorithm - $\text{gcd}(x, y) = \text{gcd}(y, x \% y)$

$$\gcd(x, 0) = \text{gcf}(0, x)$$

$$\text{eg} - \gcd(24, 15) = \gcd(15, 9)$$

$$\text{gcd}(9, 6)$$

$$\text{gcd}(6, 3)$$

$$\gcd(3^0)$$

```
+ H static int gcd(int x, int y) {
```

L2 if ($y == 0$) return x ;

L3 return gcd(y, x%y);

۱۴۳

Dry run -

	$x = 2$	
	$y = 0$	
$3 \left(\begin{array}{l} \text{gcd } x \\ \text{gcd } y \end{array} \right)$	$x = 6$	→ L
	$y = 3$	
$3 \left(\begin{array}{l} \text{gcd } x \\ \text{gcd } y \end{array} \right)$	$x = 9$	→ L
	$y = 6$	
$3 \left(\begin{array}{l} \text{gcd } x \\ \text{gcd } y \end{array} \right)$	$x = 15$	→ L
	$y = 9$	
$3 \left(\begin{array}{l} \text{gcd } x \\ \text{gcd } y \end{array} \right)$	$x = 24$	→ L
	$y = 15$	
$3 \left(\begin{array}{l} \text{main } d \\ \text{gcd } (24, 15) \end{array} \right)$		

$$x = 24$$

$$\text{Ans - ACD} \Rightarrow 3$$

This is better approach

* How to find LCM

W.K.T
 $LCM * GCD = X * Y$

$$LCM = \frac{X * Y}{GCD}$$

* HW Armstrong no using recursion, Multiplication of X & Y

36

Recursion on Arrays

Question - Given an Array print all its values recursively

* while using recursion on Arrays we use a index parameter so that to traverse in the Array, we can point to current indexes inside the Array on which we are currently pointing.

Big problem - $f(\text{arr}, \text{idx}) \rightarrow$ For a given array arr, print all elements starting from index idx.

Small problem - $f(\text{arr}, \text{idx}+1)$

Self work - $\text{Sout}(\text{arr}[\text{idx}])$

Basecase - empty Array

$f(\text{arr}, 0) \parallel 5$

$f(\text{arr}, 1) \parallel 6$

$f(\text{arr}, 2) \parallel 7$

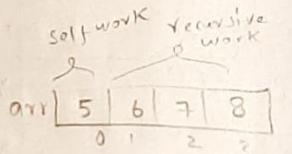

$f(\text{arr}, 3) \parallel 8$

$f(\text{arr}, 4) \parallel$

→ Basecase

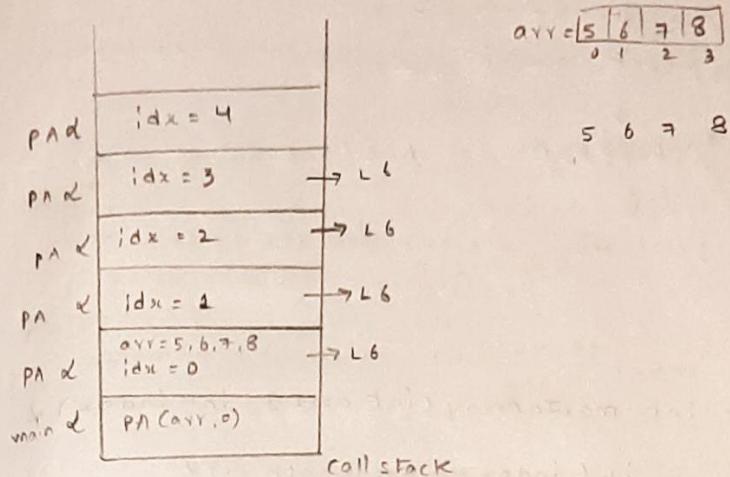

$n=4$

$\text{if } (\text{idx} == n) \parallel n=4$
 returns

```
* static void printArray(int[] arr, int idx) {
    if (idx == arr.length) {
        return;
    }
    System.out.println(arr[idx]);
    printArray(arr, idx + 1);
}
```

* Dry Run

problem - print the Max value of the Array [3, 10, 3, 2, 5]

Bigger problem - $f(\text{arr}, \text{idx}) \rightarrow$ max value in the array starting from index idx

Smaller problem - $f(\text{arr}, \text{idx}+1) \rightarrow$

self work
 Recursive work (find the max smallAns value from idx+1 index)

Self work - $\text{Compare}(\text{smallAns}, \text{arr}[\text{idx}])$

Basecase - $\text{if } (\text{idx} == n-1)$
 ↙
 return arr[idx]

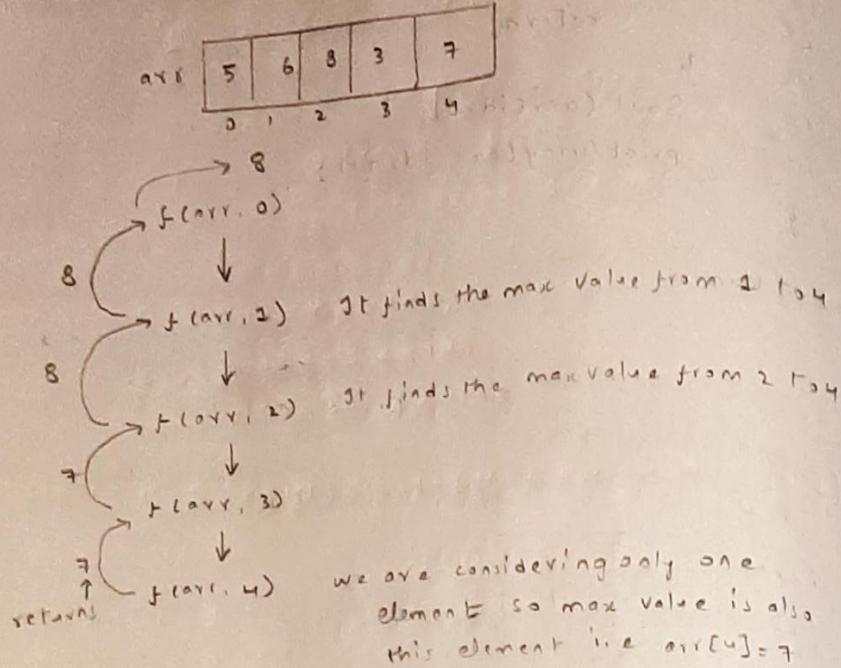

$n=5$
 $n-1=4$

Single element

i.e. If $\text{idx} == 1$
 it finds the max value from 2 i.e. 10 &
 but in case of 4 it is
 only one element so max
 value is also that element

Recursive Tree -

* L1 static int maxInArray(int arr[], int index) {

```
L2     if (index == arr.length - 1) {
L3         return arr[index];
L4     } else {
L5         int smallAns = maxInArray(arr, index + 1);
L6         return Math.max(arr[index], smallAns);
L7     }
```

* Dry run -

	arr [5 6 8 3 7] 0 1 2 3 4	max = 8 //
7 (M d	index=4	
7 (M d	index=3 → L5	
7 (M d	index=2 → L5	
8 (M d	index=2 → L5	
8 (M d	arr=[5 6 8 3 7] index=0 → L5	
8 (Main d	MC(arr, 0)	
	CALL STACK	

TC → No. of calls * Time taken in one call
 FE

No. of calls = $n * c$

TC → $n * c$

length of the Array

TC → $O(n * c) \approx O(n)$

S.C → $O(n)$ (because no. of stack frames used are same as length of Array) but if we do this problem in iterative method the Space complexity will be $O(1)$

* Problem - Find the sum of the elements of some logic as above problem. the Array [2, 3, 5, 20, 1]

Ans → 31

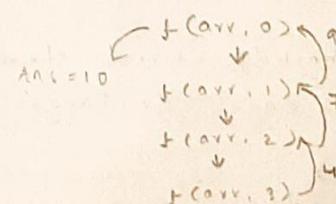

Bigger problem → f(arr, idx) ⇒ sum of array starting from index idx

Base case → if the Array have only one element return that element i.e if ($index == n - 1$) return arr[index] or if arr is empty return 0. if ($index == n$) (Out of Array) return 0;

smaller problem → arr [2 | 3 | 5 | 20 | 1]
 ↓
 self work recursive work sum of Array starting from index idx+1

self work → add (arr[index], recursive work)

Recursive Tree → arr [1 | 2 | 3 | 4] = 10

Dry run - Similar to maxInArray code - refer VSCode

TC → O(N)

SC → O(N)

37

Linear Search Using Recursion

Problem - Given an array of n integers and a target value x . print whether x exists in the array or not.

constraints : $0 \leq n \leq 10^6$,
 $-10^8 \leq x \leq 10^8$
 $-10^8 \leq a[i] \leq 10^8$

ip1 : $n=8, x=14, \text{array} = [4, 12, 54, 14, 3, 8, 6, 2]$

Op1 : Yes

ip2 : $n=2, x=9, \text{array} = [2]$

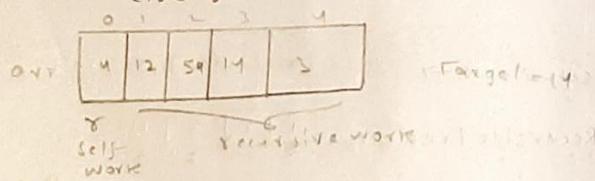

Op2 : No

Bigger problem - $f(\text{arr}, \text{target}, \text{id}x)$

↓
 starting from index $\text{id}x$ if
 target is present in arr,
 return true or return false

Smaller problem - $f(\text{arr}, \text{target}, \text{id}x+1)$

↓
 starting from $\text{id}x+1$ if target
 is present in arr return true
 else false.

Self-work - compare check if current element $\text{arr}[\text{id}x]$ is equal to target

Basecase - if ($\text{id}x == n$) || empty array (full array is checked but target element not found)

a	1	4	5	6
0	1	2	3	

$n=4$
 target = 5

$f(a, 5, 0)$

$f(a, 5, 1)$

$f(a, 5, 2)$ returns true

$f(a, 5, 3)$

$f(a, 5, 4)$ } → this call will not be called for above array.

* static boolean search(int[] a, int target, int idx) {

l2 if ($\text{id}x \geq \text{arr.length}$) {

l3 return false;

l4 } if ($\text{a}[\text{id}x] == \text{target}$) return true;

Problem - Given an Array arr of size N and an integer x. The task is to find all the indices of the integer x in the Array.

Input - arr = [1, 2, 3, 2, 2, 5], x = 2

Output - 1, 3, 4

Input - arr = [8, 8, 8], x = 8

Output - 0, 1, 2

* Logic refer above problem.

Follow up questions

1. Implement is sorted method → Yes or No
 Return boolean
2. Find last index of target in arr

38

Recursion on Strings

- * In case of Arrays if we want a particular element to read we use -

arr = [1, 2, 3] // array

arr[0] // 1

- * But in case of strings if we want to read a character we use -

String s = "Suraj"

char ch = s.charAt(0); // s

- * In case of Arrays if we want to find length we use arr.length() (property)

- * but in strings if we want to find the length we use -

s.length(); (method)

- * Substring method takes 2 parameters i.e beginIndex and endIndex i.e

String s = "Suraj";

Sout(s.substring(2, 4)); // ra

beginIndex is Inclusive and endIndex is exclusive means in above example from 2 to 4 only ra will be printed because at Index 2 a is present which is inclusive and a is at Index 3 which is also be printed but not 4.

* endIndex maximum value will be length of the string

* endIndex is also optional for substring method.

problem - Remove all occurrences of 'a' from string s = "abca x".

olp = b c x

Iterative approach -

String ans = "";

```
for (int i=0; i < s.length(); i++) {
    if (s.charAt(i) != 'a') {
        ans += s.charAt(i);
    }
}
```

Recursive Approach - Approach 1
 ↓
 current index

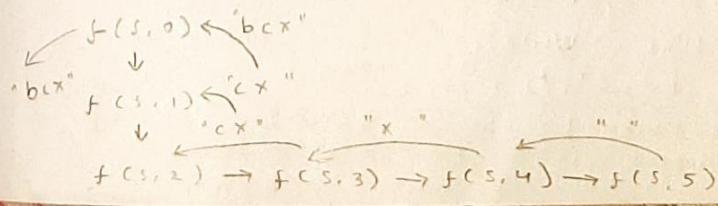

Big problem - f(s, idx)

↓
 It will remove all occurrences of 'a' in the string s starting from index idx

f(s, idx) = {
 ↓ ↓
 f(s, idx+1), s.charAt(idx) == 'a'
 current + f(s, idx+1), s.charAt(idx) != 'a'
 ↓ ↓
 self work recursive work

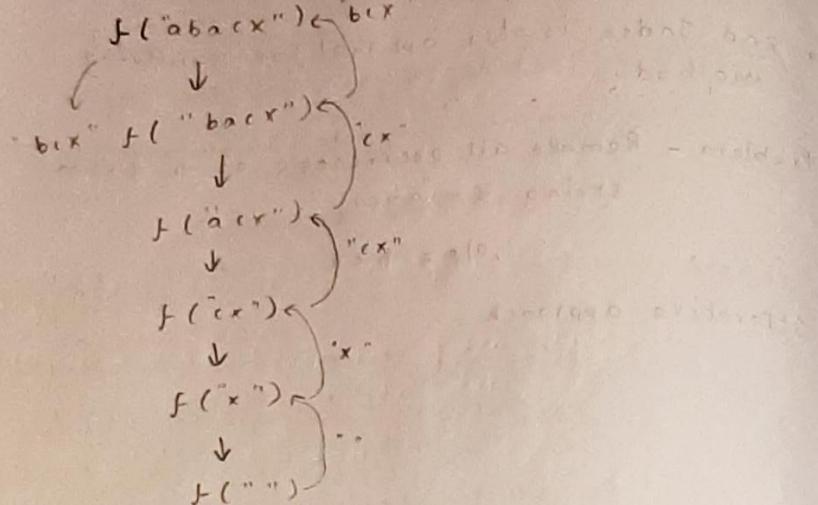

Basecase - if (idx == s.length())
 return "";

Recursive tree - s = "a b c x"
 ↓ ↓ ↓ ↓ ↓
 0 1 2 3 4 n=5

Approach 2 - Previous problem without passing index -

Recursive tree - $s = "abacx"$ o/p - $"bcx"$

* using substring method we can solve the problem without passing index i.e

$s.substring(1);$ // "aback"
 ↓
 // ("back")
 read characters from Index 1

* Time complexity → No. of calls * Time Taken in 1 call

Approach 1 → $n * (n + c)$
 ↓
 because of (currentchar + smallAns)

i.e string concatenations are not constant they are linear $(n+m)$

$$Tc \rightarrow O(n^2)$$

* why string concatenations are linear?

let say
 $str1 = "Hello";$ \leftarrow length=n

$str2 = "World";$ \leftarrow length=m

$str = str1 + str2$

Time taken to concat both the strings will depend upon length so it is linear $(n+m)$

* using stringbuilders we can read string concatenations in constant time, but in C++ string concatenations are always linear (in Java)

Approach 2 → using substring

$$n * 2n \rightarrow 2n^2 = n^2$$

$$O(n^2)$$

* substring methods takes linear time, while passing index in parameters doesn't take extra time.

problem - WAP to print reverse of a string using recursion.

$s = "abcde"$

o/p - $"edcba"$

$s = "a b c d e"$

self recursion

Bigger problem → $f(s, idx)$

idx

reverse the string starting from index (idx)

Small Ans → $f(s, idx+1)$

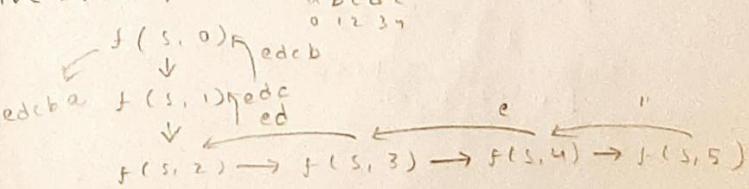

↓
reverse of string starting from index $(idx+1)$

Self work → Small Ans + current char

$f(s, idx) \rightarrow f(s, idx+1) + s.charAt(idx)$

Base case → if($idx == n$) return "";

Recursive tree → $"abcde"$

Approach 2 -
using substring reverse the string without
passing index.

Refer code.

Time Complexity \rightarrow No. of calls * Time taken

Approach 2 $\rightarrow n \times n$
 $O(n^2)$

Problem - WAP to check given string is
Palindrome or not

s = "dad" Yes

s = "level" Yes

s = "Collega" No

s = "Suraj" No

s = "Vaishu" No

Method 1 - Use previous problem to reverse
the string check original string up
reverse string using s.equals(rev)
TC $\rightarrow O(n^2)$

Method 2 - (without reversing the string check if
Palindrome?)

* s = "level";
0 1 2 3 4 n = 5

True

f(s, l, r)
↓
f(s, 1, 3) true
↓
f(s, 2, 2) true

* S = "abcdeba"
0 1 2 3 4 5 6 n = 7 PE
p h i b e d c a n p d n t b n i t

f(s, 0, 6) true (0 to 5)
↓
f(s, 1, 5) true If the values at 0, 6 are same
then only they will move to 1, 5
↓
f(s, 2, 4) true
↓
f(s, 3, 3) true

* f(s, l, r) = s.charAt(l) == s.charAt(r) && f(s, l+1, r-1)
so l, r
Recursive case

Basecase \rightarrow abcdeba
l r
l \geq r

if l \geq r
return true

L1 static boolean isPalindrome(String s, int l, int r)
L2 if (l \geq r) return true;
L3 return (s.charAt(l) == s.charAt(r) &&
isPalindrome(s, l+1, r-1));

L4 }

	S = "radar"; 0 1 2 3 4
return	Pd
↓	True
f = 2	Pd
l = 2	→ L3
r = 3	
T	(Pd)
↓	T
f = 0	→ L3
l = 0	
r = 4	
T	(Pd)
↓	main of
P(s, l, r)	call stack

S = "radar";
0 1 2 3 4

TC = no. of calls * Time taken

= $\frac{n-1}{2} \times C$

TC = O(n)

Follow up question -
* check if give integer
is palindrome or not

39

Find Subsequences using Recursion

Problem - Return subsequence.

Given a string, write a method to return all its subsequences in an arraylist. (A string is a subsequence of a given string that is generated by deleting some character of a given string without changing its order.)

Input: abc

Output: a, b, c, ab, bc, ac, abc

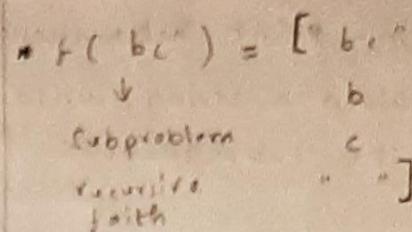

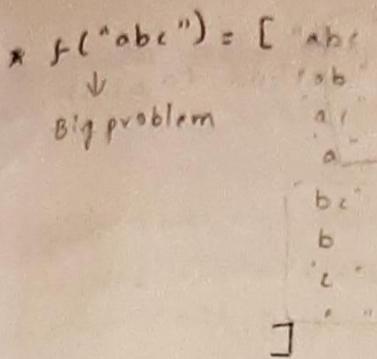

"abc"	abc	abc
n=3	ab	<u>ab</u> deleted
Total Subsequences	ac	a-c
$2^n = 2^3 = 8$	a	a-
	bc	-bc
	b	-b-
	c	--c
	" "	--- Deleted

If we have a string of length 3, all 3 have 2 choices that they should be present and not present. i.e. from above, a is present in 4 cases but not present in another 4 cases. b is present in 2 cases but not present in another 2 cases. Similarly, c.

$$2 \times 2 \times 2 = 2^3$$

choices

* If we have a string of length n of choices 2 then $2 \times 2 \times 2 \times \dots = 2^n$

* Self work

$$a + f(bc) = \begin{matrix} "abc" \\ "ab" \\ "ac" \\ "a" \end{matrix}$$

$$f(bc) = \begin{matrix} "bc" \\ "b" \\ "c" \\ "" \end{matrix}$$

Recurrence relation -

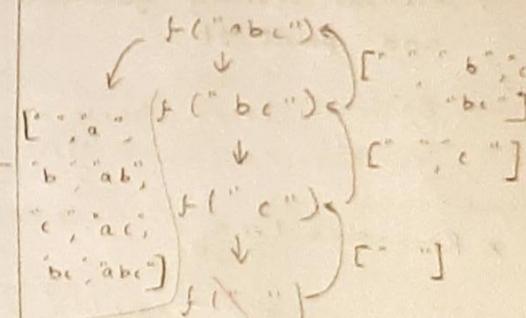

$$f("abc") = a + f("bc")$$

+ element
(elements)

$$f("bc") = \underline{\underline{f("c")}}$$

+ element

Recursive Tree

Dry run - Refer code in VS
s = "abc" code
ans = [""]
ans = ["", "c"]
ans = ["", "b", "c", "bc"]
ans = ["", "a", "b", "ab", "c", "ac", "bc", "abc"]

Base case -

i.e. (s.length() == 0)
return [];

s.s = O(2^n)

gsl	s = "	→ L1B
gsl	s = c	→ L1B
gsl	s = bc	→ L1B
gsl	s = abc	→ L1B
main	gsl(abc)	call stack

Problem - Print Subsequences
Given a string. write a method to print all its subsequences

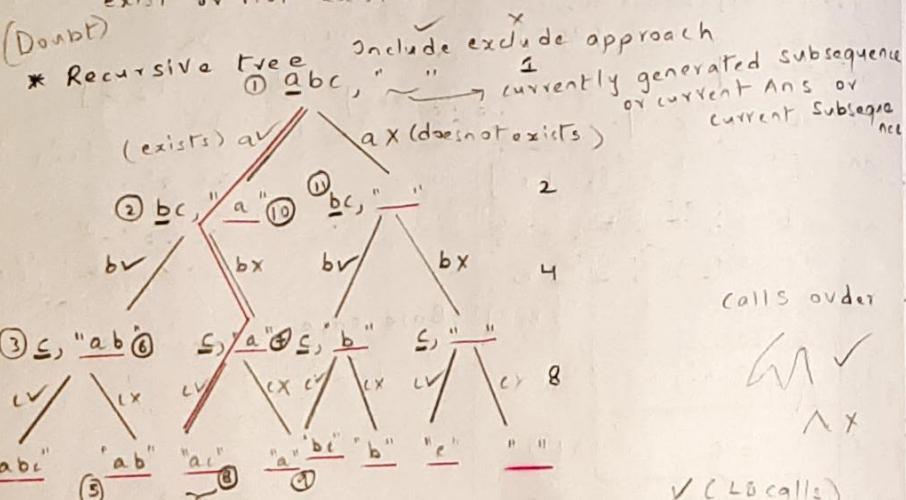

* In previous question they have said that create an ArrayList and store all its subsequences. In this question they are saying that without storing them print all its subsequences.

* The size of ArrayList in previous question will be 2^n elements which for length n there will be 2^n elements which consumes a lot of space so in this question prove that without consuming any space print the subsequences.

→ without storing generate the subsequence and print it

→ Basically every character has a choice to exist or not exist in a given subsequence

(Doubt)

Redline for "ac"
ac is the combination of choices made by a, b, c

```

* L1 static void printSSQ (String s, String currentAns)
L2     if (s.length() == 0) {
L3         System.out.println(currentAns);
L4         return;
L5     }
L6     char currentchar = s.charAt(0);
L7     String remstring = s.substring(1);
L8     printSSQ (remstring, currentAns + currentchar);
L9     printSSQ (remstring, currentAns);
L10
    
```

(Double)

soon	
-	
-	
-	
→ SSQ()	
SSQ()	
→ L12	
SSQ()	
SSQ()	
Main	SSQ (s, c)

s = "abc"
currentAns = ""

abc, ab

Note: At any point Maximum no stack frames are $n+2$

Total space consumed = No of stack frames at any given instance * space occupied in 1 stack frame

$(n+1) \times n$

$\therefore C = O(n^2)$

✓ (Local calls)
✗ (L9 calls)

Problem - Given an Array of integers, print sums of all subsets in it. Output sums can be printed in any order

ilp - arr[] = {2, 3, 4}

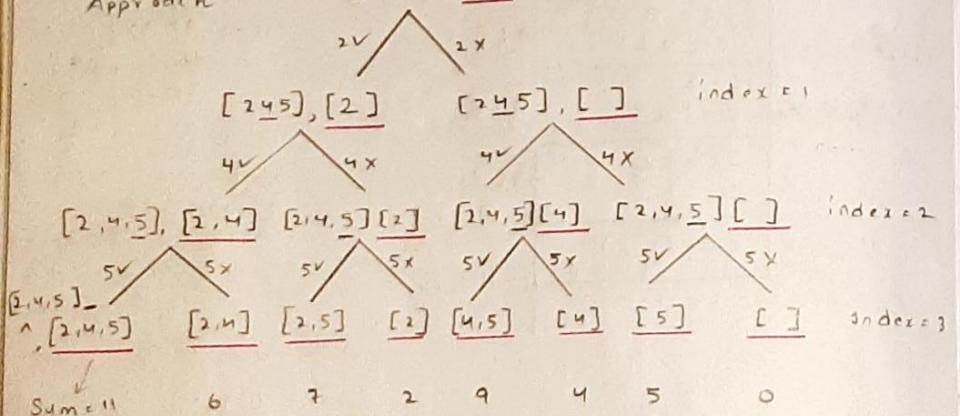

olp - 0 2 3 5

ilp - arr[] = {2, 4, 5, 4}

olp - 0 2 4 5 6 7 9 11

Subsets	sum
{2, 4, 5}	11
{2, 4}	6
{2, 5}	7
{2}	2
{4, 5}	9
{4}	4
{5}	5
[]	0

* Inclusive-exclusive Approach [2, 4, 5], [], index=0

40

Recursion on Array of Strings

problem - Frog Jump

There are N stones numbered 0, 1, 2, ..., $N-1$. For each i ($0 \leq i < N$), the height of stone i is h_i . There is a frog who is initially on stone 0. He will repeat the following action some number of times to reach stone $N-1$:

If the frog is currently on stone i , jump to stone $i+1$ or stone $i+2$.

Here, a cost of $|h_i - h_j|$ is incurred, where j is the stone to land on.

Find the minimum possible total cost incurred before the frog reaches stone $N-1$.

ilp - $n = 4$

arr[] = {0, 3, 0, 2, 0}

olp - 30

ways for frog to jump total cost to reach $N-1$ stone

* $0 \rightarrow 1 \rightarrow 2 \rightarrow 3 = 50$

$0 \rightarrow 2 \rightarrow 3 = 50$

$0 \rightarrow 1 \rightarrow 3 = 30$

Minimum = 30

* Let's think how we can solve this problem.
How much if we are on 0^{th} stone we can see that the cost of going to 1^{st} stone or 2^{nd} stone

* Predicting the cost from 0^{th} stone to let say t^{th} stone is not possible

* Starting from stone 1 to reach last stone if we find the minimum cost we can find the minimum cost of frog to reach $N-1$ via stone 1 or 2.

- * $f(h, n, idx)$ (Bigger problem) \rightarrow
↓
Starting from idx minimum cost to reach
 $(n-1)$ index.

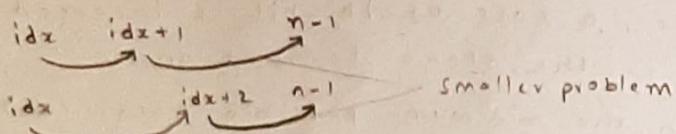

- * Smaller problem.

$f(h, n, idx+1)$

Starting from idx minimum cost to reach $(n-1)$ index

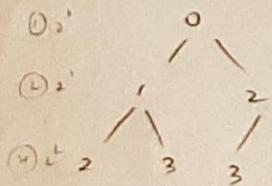

$f(h, n, idx+2)$

Starting from $idx+2$ minimum cost to reach $(n-1)$ index

$$* f(h, n, idx) = \min \left\{ \begin{array}{l} h[idx] - h[idx+1] + f(h, n, idx+1) \\ h[idx] - h[idx+2] + f(h, n, idx+2) \end{array} \right\}$$

Selfwork

Basecase: If we reach the last index i.e. $n-1$
→ Index i.e. the minimum cost to reach to index is 0 i.e. minimum cost to reach $n-1$ to $n-1$ is 0.
if ($idx == n-1$)
return 0.

→ and if we reach the last second index i.e. $n-2$ we cannot find $n-2$ ($idx+2$) so return minimum cost is from opt_1 .

Time complexity → Total no. of calls & time taken
from recursive tree

a-z : 97 to 122

A-Z : 65 to 90

Characters 0-9 : 48 to 57

* char ch = '3';

int chVal = ch - '0'

= 51 - 48
= 3
ascii code

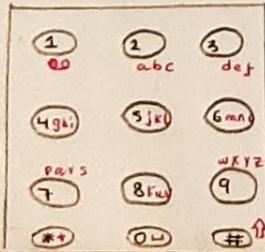

* To convert a given character to integer use minus (-) 0.

Problem -

Given a string containing digits from 2-9 inclusive, return all possible letter combinations that the number could represent. Return the answer in any order.

inp-digits = "23"

olp - ["ad", "ae", "af", "bd", "be", "bf", "cd", "ce", "cf"]

"23"

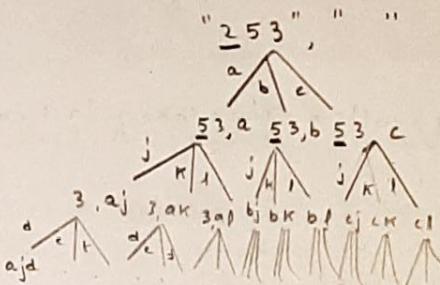

a	• (cross 1 time)
b	.. 2
c	.. 3
d	• 1
e	.. 2
f	... 3

ad ae af bd be bf cd ce cf

Total no. of combinations are $\rightarrow 3 \times 3 = 9$

$$\rightarrow 4 \times 3 = 12$$

*

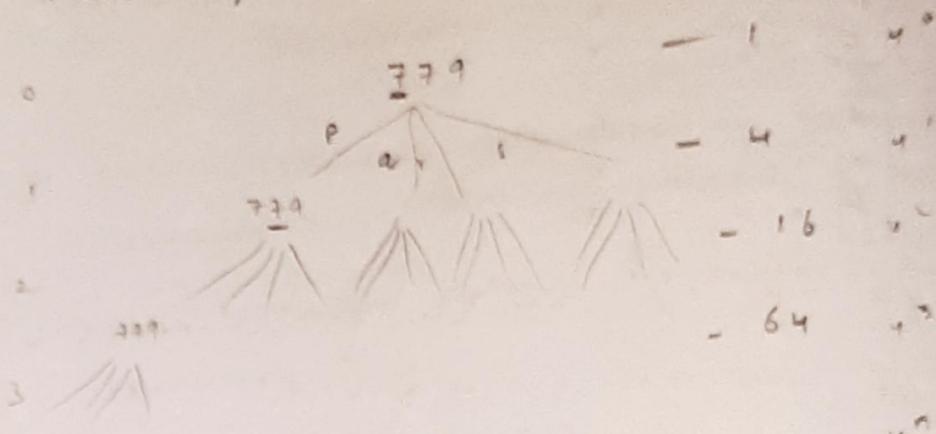

$$3 \times 2 \times 3 = 27$$

Algorithm -

- * Declare string eg string digit = "23".
- * Make an array of Keypad i.e for values 2=abc, 3=def etc.
- * extract the first digit which is character convert it to int. eg string digit = "23".
- * current choices of currentdigit is in Array, Access i.e.
- * iterate a loop for current choices i.e till length of current choices.
- * In loop recursive call i.e access remaining digits using digit.substring(1) eg "23", and in current ans add firstdig choices.
- * Basecase if coldigit.length(j) == 0
 - ans (ans)
 - return;

Time complexity -

* levels:

how many digits
what many levels

$$1 + 4 + 16 + 64 + \dots = 4^n$$

$$\text{Sum} = \leq 4^n$$

T_c = Total no. of calls * Time taken in 1 call

$$\approx 4^n * (cn)$$

$$T_L = O(n4^n)$$

* Recursive Tree
